

Daily Work Report - 27/11/2025 and 28/11/2025

Please find below the summary of tasks completed by our team: - **27/11/2025**

Akshay/Anugrah - (React developer)

- API encryption/decryption is still showing errors; working on it and coordinating with backend.

Anoop - (python)

In the hybrid Attendance app admin pannel shift case database updation views
updation creation view

session completed. punch in session views updations

Cinda - Python

Implemented Encryption in Attendance Application:

Continued integrating and refining the **encryption module** within the Attendance Application to enhance security across all request and response flows. This ensures that sensitive employee and attendance data is securely handled using robust cryptographic methods, thereby strengthening the overall data protection framework of the system.

- **Video Shooting Activity:**

Participated in the **video shooting** session as part of the project's promotional or documentation-related activities. This involved coordinating with the team, preparing relevant content, and contributing

to recordings as required.

Athulya - (UI/UX)

Today, completed some additional changes in the Attendance App pages based on the suggestions provided by Sherin sir. After that, I made the required updates in the Lottery App pages as well.

In the afternoon, went for the promotion video shoot as assigned.

Anena - (AI /ML)

Yesterday, focused on refining the face-detection and Streamlit attendance system. cleaned the Streamlit app (app.py) by removing unused imports and outdated functions, and verified that new employee registrations are saved correctly in faces.json and attendance entries in attendance.csv. also reviewed the detection logic and tested the optimized recognition loop with the Frame Skipping method. However, due to limitations with the Wi-Fi IP camera input, the system still experiences noticeable lag and is not fully ready for demonstration.

Ashvin - (AI / ML)

Today, completed the refinement of the face-detection and attendance system. After evaluating the performance issues caused by the Wi-Fi IP camera, removed the Streamlit interface to eliminate lag and network-related delays. The core detection and verification pipeline was reviewed thoroughly, and all functionalities— including employee registration and attendance recording—were confirmed to work correctly through the backend. With the system now running more smoothly without the additional Streamlit layer, today's tasks have been successfully completed.

Devadathan -(Tester)

1. Ongoing: Attendance Mobile App Automation (Appium)

We are continuing the script development for the **Ziya Attendance Mobile App**.

- **Status:** We are currently finalizing the automation scripts for the login and initial check-in workflows.
- **Next Steps:** Once the core flows are scripted, we will execute a dry run to verify stability.

2. New: MCP Server Automation (Selenium)

We have started implementing **automation tests using Selenium with the MCP server**.

- **Goal:** To establish a robust web automation framework managed via the MCP server environment.
- **Status:** Configuration and initial setup are currently in progress.

3. Ongoing: Mobile App Data Encryption

We are continuing to verify the **data encryption** implementation on the main mobile application.

- **Focus:** We are currently performing deep-dive tests on data storage to ensure encryption persists correctly after app updates and restarts.

4. Ongoing: Interns Training & Project Preparation

The **training sessions for the interns** are progressing. They are currently assisting with the documentation of test scenarios for the upcoming project cycle.

28/11/2025

Akshay/Anugrah - (React developer)

- Created new pages.
- Worked on API encryption.
- Currently only one encryption error remaining, trying to fix it ASAP.

Anoop - (python)

In the Hybrid Attendance application, updating the core punch-in and punch-out session functions to ensure accurate shift-based status tracking, time-wise attendance validation, and proper session completion handling. I am also conducting in-depth research on how to integrate AI/ML models with Django to enhance automation, prediction, and intelligent decision-making within the system.

Implemented Encryption in Attendance Application:

Continued integrating and refining the **encryption module** within the Attendance Application to enhance security across all request and response flows. This ensures that sensitive employee and attendance data is securely handled using robust cryptographic methods, thereby strengthening the overall

data protection framework of the system.

- **Video Shooting Activity:**

Participated in the **video shooting** session as part of the project's promotional or documentation-related activities. This involved coordinating with the team, preparing relevant content, and contributing to recordings as required.

Athulya - (UI/UX)

Today, completed some additional changes in the Attendance App pages based on the suggestions provided by Sherin sir. After that, I made the required updates in the Lottery App pages as well.

In the afternoon, went for the promotion video shoot as assigned.

Anena - (AI /ML)

Today, completed the updates to the face-detection and attendance system. After analyzing the significant lag caused by the Wi-Fi IP camera, removed the Streamlit interface to reduce overhead and stabilize performance. I then reviewed and confirmed that the core detection workflow, employee registration process, and attendance recording continue to function correctly through the backend. With these adjustments, the system now runs more efficiently, and the planned tasks for the day have been successfully completed.

1. Ongoing: Attendance Mobile App Automation (Appium)

We are making steady progress on the Ziya Attendance Mobile App automation.

- Status: The automation scripts for the login and initial check-in workflows have been drafted.
- Current Activity: We are currently executing dry runs to validate the script stability and handling edge cases (e.g., network timeout during check-in).

2. Ongoing: MCP Server Automation (Selenium)

We are continuing the implementation of automation tests using Selenium with the MCP server.

- Status: The initial environment configuration is complete. We are now mapping the first set of test cases to the Selenium framework within the MCP environment.

3. Ongoing: Mobile App Data Encryption

We are continuing to verify the data encryption implementation on the main mobile application.

- Focus: We are wrapping up the storage encryption tests and shifting focus to verifying data integrity during data migration scenarios (upgrading from a non-encrypted version).

4. Ongoing: Interns Training & Project Preparation
